CORN GRAIN HYBRID TESTS IN TENNESSEE

2016

Experimental Procedures:

Research and Education Center Tests: All corn hybrid trials were conducted in each of the physiographic regions of the state. Tests were conducted at the Ames Plantation (Grand Junction), Highland Rim (Springfield), East TN (Knoxville), and Milan (Milan) Research and Education Centers (**REC**). The Early and Medium-season tests were also planted at the Agricenter International Research Center (Memphis). **Duplicate plantings** of the early-, medium- and full-season tests were made at the **Milan and Highland Rim Research and Education Centers** for performance testing **with and without irrigation**.

The corn hybrids were placed in either the **early-, medium-, or full-season tests** based on the maturity as reported by the company providing the hybrid. The early season test contained hybrids that had maturity <114 days after planting (DAP); the medium season test contained hybrids with maturity of 114-116 DAP; and the full season test contained hybrids with maturities >116 DAP. All corn hybrid trials were planted to uniform populations per acre at each location using a precision seeding planter. Plant populations of 36,000 plants per acre for irrigated plots and 34,000 plants per acre for non-irrigated plots were the goal at all locations. Populations varied with location but attempts were made to make the population the same for all hybrids at a given location (Table 1). Tests were conducted using 30 inch row spacing. The tests were fertilized with approximately 230 lbs N/a. A portion of the nitrogen was applied prior to planting (e.g. 80 lbs/a) and the remainder was applied as a side-dress (e.g. 150 lbs/a). The plot size was two, 30-ft. rows. Plots were replicated three times at each location. An incomplete block design was used at each location in order to reduce the within replication variation.

County Standard Tests: The County Standard Corn Tests were conducted in 26 counties in Tennessee, and four counties in Western Kentucky. The number of counties depended on the test. The County Standard Tests were divided into **early-, medium-, and full-season glyphosate resistant and Bt stacked trait tests** (same DAP criteria as listed above; some entries were stacked with Bt resistance genes). Each hybrid was evaluated in a large strip-plot at each location, thus **each county test was considered as one replication of the test** in calculating the overall average yield and in conducting the statistical analysis to determine significant differences. At each location, plots were planted, sprayed, fertilized, and harvested with the equipment used in the cooperating producer's farming operation. The width and length of strip-plots were different in each county; however, within a location in a county, the strips were trimmed on the ends so that the lengths were the same for each variety, or if the lengths were different then the harvested length was measured for each variety and appropriate harvested area adjustments were made to determine the yield per acre.

Growing Season: The 2016 season started early with planting well ahead of the five year average. By the beginning of May, 80% of corn had been planted compared to only 57% in 2015. In mid-May, heavy rainfall and cool weather inhibited emergence in some areas, necessitating replanting. The remainder of the season was marked by hot, dry conditions. By mid-August, only 66% of the crop rated good to excellent. Corn harvest was slightly ahead of the five year average, with 89% of grain corn harvested by the beginning of October. According to the Tennessee Agricultural Statistics Service, producers planted 870,000 acres this year, an increase of 100,000 acres from 2015. Acreage harvested for grain is projected to be 800,000 acres, up 70,000 acres from last season. Corn grain production for 2016 is projected to be 118.4 million bushels, averaging 148 bu/a. Compared to 2015, this is an increase in production of 1.6 million bushels but a decrease in yield of 12 bu/a.

Interpretation of Data:

The tables on the following pages have been prepared with the entries listed in order of overall average performance across locations, the highest-yielding entry being listed first. **All yields presented have been adjusted to 15.5% moisture (the moisture standard for U.S. No. 2 corn).** At the bottom of the tables, LSD values stand for **Least Significant Difference**. The mean yields of any two varieties being compared must differ by at least the amount shown to be considered different in yielding ability at the 5% level of probability of significance. For example, given that the LSD for a test is 8.0 bu/a and the mean yield of Hybrid A was 110 bu/a and the mean yield of Hybrid B was 115 bu/a, then the two hybrids are not statistically different in yield because the difference of 5 bu/a is less than the minimum of 8 bu/a required for them to be significant. Similarly, if the average yield of Hybrid C was 123 bu/a then it is significantly higher yielding than both Hybrid B ($123 - 115 = 8$ bu/a = LSD of 8) and Hybrid A ($123 - 110 = 13$ bu/a > LSD of 8).

Also, the **coefficient of variation (C.V.)** values are shown at the bottom of each table. This value is a measure of the error variability found within each experiment. It is the percentage that the square root of error variance is of the overall test mean yield at that location. For example, a C.V. of 10% indicates that the size of the error variation is about 10% of the size of the test mean. Similarly, a C.V. of 30% indicates that the size of the error variation is nearly one-third as large as the test mean. A goal in conducting each yield test is to keep the C.V. as low as possible, preferably below 20 percent.

Results

Yield and Agronomic Traits. One hundred corn hybrids were evaluated in the 2016 **Research and Education Center (REC)** tests in Tennessee. There were 40 hybrids in the early- (Tables 2-7), 40 in the medium- (Tables 8-13), and 20 hybrids in the full-season (Tables 14-19) tests. The 100 hybrids represent 19 different brands (Table 27). The **County Standard (CS)** tests consisted of a early-season glyphosate resistant and Bt stacked trait test (21 hybrids at 16 locations, Table 20), a medium-season glyphosate resistant and Bt stacked trait test (27 hybrids at 26 locations, Table 21), and a full-season glyphosate resistant and Bt stacked trait test (14 hybrids at 18 locations, Table 22) for a total of 62 hybrids. In addition to 26 Tennessee counties, the County Standard tests involved Calloway, Carlisle, Fulton and McCracken counties in Western Kentucky. Common to both the REC and CS tests were 17 early-season, 18 medium-season, and 8 full-season hybrids (Tables 23-25). Similar to the REC tests, in the CS tests all hybrids were placed in the maturity test for which they fit regardless of other traits associated with each entry.

Ninety-five of the 100 hybrids in the 2016 REC tests have a Bt gene for corn borer resistance (denoted by 3000GT, Bt, CB, HX, SSX, VT2, VT3, YG, YGCB,); 51 have a gene for corn root worm resistance (denoted by 300GT, RW, SSX, VT3); 94 have a Roundup Ready gene for tolerance to glyphosate herbicide (denoted by RR, RR2, GT); 44 have a gene for tolerance to Liberty (glufosinate) herbicide (denoted by LL); four hybrids are conventional and contain no transgenes; one hybrid contains a single transgene; 85 are stacked with combinations of RR, Bt, RW, LL. Abbreviations used to denote biotech seed traits can be found in Table 28.

Irrigated vs. Non-irrigated Yields. Duplicate tests were conducted at the Milan and Highland Rim Research and Education Centers with and without irrigation. Due to dry conditions during the growing season, a difference in irrigated and non-irrigated corn tests was observed. This was most apparent at the Milan location, where the dry period coincided with pollination, causing poor kernel set and drastically reducing yields in the non-irrigated tests (Figure 1). The average difference in yields across hybrids that were irrigated versus those not irrigated at Milan were: 135 bu/a for early-season hybrids (Table 2), 161 bu/a for medium-season hybrids (Table 8), and 144 bu/a for full-season hybrids (Table 14). Irrigated and non-irrigated yields at Highland Rim showed much smaller yield differences. Both early and full season hybrids exhibited a yield advantage in the irrigated tests. Compared to non-irrigated tests, irrigated early-season hybrids exhibited a 3

bu/a advantage and irrigated full-season hybrids exhibited a 10 bu/a advantage. In contrast, medium season hybrids exhibited an 11 bu/a yield advantage in the non-irrigated test compared to the irrigated test.

Heavy rainfalls shortly after planting resulted in poor stands at several test locations. At Agricenter, all three tests were dropped and were not replanted. At Ames Plantation, the early and medium tests were the most affected. These two tests were replanted on May 31. The late planting and hot, dry conditions throughout the growing season resulted in very low yields and high variation in both tests. For these reasons, both early and medium tests at Ames Plantation were excluded from analyses.

Figure 1. Poor kernel set in corn from non-irrigated trials at Milan. Cobs on the far right and far left are from irrigated plots for comparison. Picture was taken Aug. 3rd, 2016.

§ If a trait appears inside parentheses i.e. (RR/CB), then it is not part of the hybrid name. For a full description of abbreviated biotech traits, see table 28.

† All yields are adjusted to 15.5% moisture.

‡ Three additional locations were planted but discarded.

- Milan non-irrigated: Drought at a crucial period during pollination caused differential yield losses that were likely influenced by hybrid flowering date (C.V. = 19%, mean = 116 bu/a).

- Ames Plantation: Heavy flooding caused poor germination and uneven stands. Late replant (May 30) resulted in poor yield and high within test variation (C.V. = 52%, mean = 68 bu/a).

- AgriCenter International: Heavy flooding caused poor germination and uneven stands (not harvested).

§ If a trait appears inside parentheses i.e. (RR/CB), then it is not part of the hybrid name. For a full description of abbreviated biotech traits, see table 28.

†All yields are adjusted to 15.5% moisture.

‡ Three additional locations were planted but discarded.

- Milan non-irrigated: Drought at a crucial period during pollination caused differential yield losses that were likely influenced by hybrid flowering date (C.V. = 19%, mean = 116 bu/a).

- Ames Plantation: Heavy flooding caused poor germination and uneven stands. Late replant (May 30) resulted in poor yield and high within test variation (C.V. = 52%, mean = 68 bu/a).

- AgriCenter International: Heavy flooding caused poor germination and uneven stands (not harvested).

§ If a trait appears inside parentheses i.e. (RR/CB), then it is not part of the hybrid name. For a full description of abbreviated biotech traits, see table 28.

†All yields are adjusted to 15.5% moisture.

‡ Three additional locations were planted but discarded.

- Milan non-irrigated: Drought at a crucial period during pollination caused differential yield losses that were likely influenced by hybrid flowering date (C.V. = 29%, mean = 87 bu/a).

- Ames Plantation: Heavy flooding caused poor germination and uneven stands. Late replant (May 30) resulted in poor yield and high within test variation (C.V. = 34%, mean = 113 bu/a).

- AgriCenter International: Heavy flooding caused poor germination and uneven stands (not harvested).

† Data Provided by Ryan Blair, Ext. Area Specialist, Grain and Cotton Variety Testing, and Extension agents in counties shown above.

‡ MS=Hybrids that have any MS letter in common are not significantly different in yield at the 5% level of probability. Hybrids marked with an asterisk (*) were in the top performing "A" group for consecutive years.

§ YLD=Avg. Yield @ 15.5 % moisture

|| %M=Avg. % moisture across all locations.

¶ TstWt=Avg. test weight lbs/bu @ all locations.

Planting date

†† Indicates locations with irrigation

County Locations include: Benton, Calloway KY, Cannon, Coffee, Dyer, Fayette, Franklin, Gibson, Giles, Hardeman, Henry(2), Hickman, Lake, Madison, Monroe, Montgomery, and Weakley.

Table 28. Abbreviations used to identify biotech traits of corn grain hybrids evaluated in Tennessee during 2016.

Abbreviation	Name	Characteristic
3000GT	Syngenta Agrisure® 3000GT	Cry1Ab, Modified Cry3A. Protection from Corn Borer, Western, Northern and Mexican Corn Rootworm. Glufosinate tolerance and Glyphosate tolerance. Event: SYTGA21+Bt11+MIR604
AM	AcreMax	Cry1F, Cry1Ab. Protection from Black Cutworm, Eastern Corn Borer, Fall Armyworm, Sugarcane Borer, Southern Corn Borer, Western Bean Cutworm, Corn Earworm. Glufosinate tolerance and Glyphosate tolerance.
CB/LL	Agrisure CB/LL	Cry1Ab, PAT. Protection from Corn Borer. Event: Bt11
DG	Genuity DroughtGard™	Event: MON 87460
GT	Syngenta Agrisure® GT	Glyphosate tolerance. Event: SYTGA21
HX1	DowAgrosciences Pioneer Hi-Bred Herculex® I	Cry1F. Protection from Western Bean Cutworm, Corn Borer, Black Cutworm and Fall Armyworm resistance. Glufosinate herbicide tolerance. Event: TC1507
LL	Bayer CropScience LibertyLink®	Glufosinate tolerance. Event: T25
RA	Dow AgroSciences Refuge Advanced®	
RIB	Refuge in Bag	
RR2	Monsanto Roundup Ready® Corn 2	Glyphosate tolerance. Event: NK603
RW	Agrisure RW	mCry3A. Protection from Corn Rootworm. Event MIR604
SSX	Monsanto Genuity™ SmartStax™ DowAgrosciences SmartStax™	Cry1A.105, Cry2Ab2, Cry1F, Cry3Bb1, Cry34/35Ab1. Protection from Western, Northern, and Mexican Corn Rootworms, European and Southwestern Corn Borers, Sugarcane Borer, Southern Cornstalk Borer, Western Bean and Black Cutworms, Corn Earworm, Fall Armyworm. Glufosinate tolerance and Glyphosate tolerance. Event: Mon88017+Mon89034+TC1507+DAS59122-7
VIP3110	Agrisure Viptera™ 3110	Vip3A, Cry1Ab. Protection from European and Southwestern Corn Borers, Southern Cornstalk Borer, Fall and Beet Armyworm, Black and Western Bean Cutworm, Sugarcane Borer, Common Stalk borer and Dingy Cutworm. Glyphosate tolerance. Event: MIR162+Bt11+GA21
VIP3111	Agrisure Viptera™ 3111A	Vip3A, Cry1Ab. Protection from European and Southwestern Corn Borers, Corn earworm, Southern cornstalk borer, Fall and Beet armyworm, Black and Western Bean Cutworm, Sugarcane borer, Western, Northern and Mexican corn rootworm, Common stalk borer and Dingy cutworm. Glyphosate tolerance. Contains Agrisure Artesian technology with multiple genes for season long drought protection. Event: MIR162+Bt11+GA21+MIR604
VT2P	Monsanto Genuity™ VT Double PRO™	Cry1A.105, Cry2Ab2. Protection from European and Southwestern Corn Borers, Sugarcane Borer, Southern Cornstalk Borer, Corn Earworm, and Fall Armyworm Glyphosate tolerance. Event: Mon89034+NK603
VT3P	Monsanto Genuity™ VT Triple PRO™	Cry1A.105, Cry2Ab2, Cry3Bb1. Protection from European and Southwestern Corn Borers, Sugarcane Borer, Southern Cornstalk Borer, Corn Earworm, Fall Armyworm, Western Corn Rootworm, Northern Corn Rootworm, and Mexican Corn Rootworm. Glyphosate tolerance. Event: Mon88017+Mon89034
YGCB	Monsanto YieldGard® Corn Borer	Cry1Ab. Protection from European and Southwestern Corn Borers, Sugarcane Borer and Southern Cornstalk Borer. Event: Mon810
